Backend Engineer | Agentic Systems, RAG, Applied LLMs

Technical Skills

AI/Agentic Systems: LangGraph, CrewAI, RAG, LLMs, LangChain, OpenAI Agents SDK, Text-to-SQL
Backend & Languages: Python, TypeScript, JavaScript, C++, FastAPI, Node.js, WebSockets, Microservices
Databases: PostgreSQL, MongoDB, Redis, Weaviate, MySQL
DevOps & Cloud: Docker, Kubernetes, CI/CD, Prometheus, Grafana, AWS

Experience

TheAgentic

Sep 2025 – Sept 2026

Backend Engineer — Full-time

Remote

- Built backend services using FastAPI and LangGraph to support automated workflows across multiple business use cases.
- Developed risk analysis pipeline by aggregating multi-source market data and generating automated token assessments.
- Built semantic search and matching system using embeddings and vector databases for candidate-job recommendations.

Qlaws.ai – Legal Solution

Jan 2025 – Aug 2025

Backend Engineer — Full-time

Remote

- Improved document processing pipeline using LangGraph orchestration and migrated 100K+ legal document vectors to Weaviate.
- Built document processing workflows handling extraction, validation, and generation tasks using specialized agents.
- Developed RAG-based backend services using Redis and PostgreSQL for document retrieval and conversational queries.

Dream Skrin – Supply Chain Intelligence

Oct 2024 – Jan 2025

Backend Engineer — Internship

Remote

- Designed backend intelligence layer connecting procurement, inventory, and logistics workflows.
- Built demand forecasting and automated reordering pipeline using XGBoost for supply chain optimization.
- Orchestrated distributed workflows using Temporal across multiple services.

MINTRIX – AI-Based Learning

May 2024 – Oct 2024

Backend Engineer — Internship

Remote

- Built RAG-powered chatbot using LangChain and Weaviate for student learning assistance.
- Improved API performance through caching and database query optimization.

Projects

FinShield | Python, LangGraph, FastAPI, Groq, React 🔗 🐙

- Built a fraud check where behavioral, temporal, geo, and device agents each score a transaction, and a decision agent returns allow, review, or block.
- Combined those scores into one weighted call so the verdict comes from the same signals the specialist agents already produced.
- Shipped a small React console and a public demo so a transaction can be run end to end without a local setup.

TrialSync | Python, FastAPI, PostgreSQL, Text-to-SQL 🐙

- Built a trial-matching pipeline that turns free-text eligibility into a patient search, then checks the hits with stemming and demographic filters.
- Added a scoring agent that ranks matched patients from 0 to 100 and keeps stage timings plus an audit trail of what the pipeline did.
- Cached the first-stage search per trial so a repeat run does not call the model again.

HealthSync AI | Python, LangGraph, FastAPI, Claude, Next.js 🐙

- Built a pipeline that takes clinical notes and lab values and writes a structured health report through parser, interpreter, risk, and recommendation steps.
- Added a validator pass that sends a weak section back through the pipeline before the report is compiled.
- Exposed the result as JSON and a PDF, with a small Next.js view for reading the finished report.

Education

Symbiosis Institute of Technology, Pune

2027

B.Tech in Computer Science & Engineering
